

Rule To Create Valid Identifier in C/C++

- 1. Variable/ Identifier name should be combination of alphabet's & Digits & Underscore**
- 2. No Special Symbol other than underscore is allowed**
- 3. Variable/ Identifier name should start with alphabet or an underscore (name should not start with digit)**
- 4. No limit of length for variable/ Identifier name in latest compiler**
- 5. Variable/ Identifier name should not be a Keyword in C/C++.**
- 6. No white space is allowed in variable/ identifier name**

Variable

Definition :

Meaningful name given to memory.

Declaration :

Syntax:

```
DataType <Variable_Name>;
```

Example:

```
int Roll_No;
```

```
float pi;
```

```
// Issue Of Garbage
```

Initialization :

Syntax:

```
DataType < Variable_Name > = <Initial_Value>;
```

Example:

```
int Roll_No = 55;
```

```
float pi = 3.14;
```

Assignment :

Syntax:

```
DataType < Variable_Name > = <Initial_Value>;
```

```
< Variable_Name > = <New_Value>;
```

Example:

```
int Num = 0;
```

```
Num = 66;
```

Accessing Values of Variable :

```
int Num1 = 5, Num2 = 10, Add = 0;
```

```
Add = Num1 + Num2;
```

```
printf("\n Addition is : %d",Add);
```

Rules to Create Variable Name

- 1.Name should be Alpha Numeric
- 2.Name Should start with
alphabet(Cap/Small) Or Underscore
- 3.Name Should Not Contain Any Special
Symbol other than Underscore
- 4.Name Should Not Contain Any White Space
- 5.Name Should Not Be Any Keyword

Allowed Exa.

Num
